40 or over? Have you ever been screened for Breast Cancer?

Take responsibility of
your health:
Detect the deadly
disease early

BREAST SAFE® TEST

Why breast screening is important

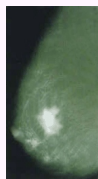

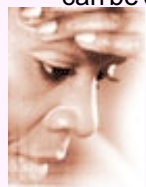

Screening for breast cancer does not prevent the disease, but it aims to detect cancer early, before symptoms occur. If detected early, survival rate exceeds 95%. Screening regularly can tell you if there is any cancer brewing in your body before it attains a size of 1-2 cm. Once detected at an early stage, breast cancer is curable.

Some facts about breast cancer

- Every two minutes a woman is diagnosed with breast cancer.
- One woman in eight who lives to age 85 is at the risk of developing breast cancer.
- Breast cancer is the leading cause of death in women between the age of 40 and 55.
- 70% of all breast cancers are found through self-examination. Not all lumps are detectable by touch.
- Early detection through screening was responsible for survival of more than 2 million people in America.

Some truth about breast cancer

- Finding a lump in your breast does not mean you have breast cancer. Eight out of ten lumps are benign, or not cancerous.
- Some breast cancers are called 'in situ' because they have not yet spread beyond the area they have begun. Nearly all cancers at this stage can be cured.

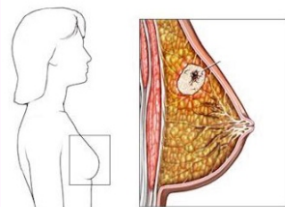

What is a Breast Safe® Test

Breast Safe® Test helps people to identify breast cancer at an early stage before the symptom appears. Breast Safe® Test is a blood test, with special logic-based profiles, to improve sensitivity in breast cancer diagnosis.

Who should take the test

Anyone who has a blood relative (grandmother, mother, sisters, aunts) diagnosed with breast cancer before the age of 50, should take the test. Statistics suggests that women with the family history run a significantly higher risk of developing breast cancer than the women without such a history.

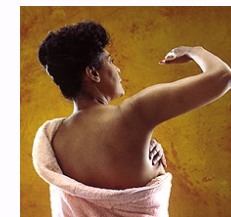

Even if there is no history of breast cancer in the family and you are over the age of 40, and you wish to be screened for breast cancer, the Breast Safe® Test is an ideal start.

How the Breast Safe® Test works

In the very early stages, breast cancer may not show any visible symptoms. Tumor Markers (molecules secreted by tumors that can be detected, and measured) appear in the blood in relation to a developing breast cancer.

EGTM (European Group for Tumor Markers) states that "tumor markers are helpful diagnostic tools in the differential diagnosis of breast cancer". These tumor markers are part of Breast Safe® Test.

How we can help you in the early detection of breast cancer

Screening for breast cancer is now well established in many countries in Europe and America. Yet we do not have a screening program in most countries in the Middle East. Most screening programs involve an ultrasound or mammogram and examination by a specialist in breast disease. This may not always be available to you where you are.

Our service offers flexibility to meet the daily challenges and busy schedules of clients. Eastern Biotech offers accurate, medically supervised and confidential genetic screening **directly to you**. Wherever you stay in the Middle East, you can get this service from Eastern Biotech.
